Math Game Abstract Review

Overall, the abstract for the Math Game Review is good. The abstract starts with simple, clear context that defines not only the goal of the project, but how it relates to the larger goal at hand. While also briefly describing the research that backs the project, and the pipeline that works from software to sheet to analysis. The NSPAM explanation takes up about half of the abstract, and rightfully so. Even though NSPAM is complex, it clearly explains what the task asks the subject to do and why it is valuable to the research.

However, as with the abstract, there are improvements to be made mainly in lack of results. It reads more like an introduction or background section, as it stops at the methodology and data collection phases without stating what the data actually revealed. This is the abstract's biggest weakness, along with the abstract being slightly redundant in it's wording.

Overall, the abstract is good at introducing the reader to the project, but that's where it stops. It fails to mention the final product or result that had been produced by this project, and instead gives suggestions for future iterations of NSPAM.
