Math Game Documentation Review

Overall, the documentation for the Math Game Review is very good. The way the documentation is split up is very clear, and it's all done in two pages, simple and efficient. The explanations given are in layman's terms so it's easy for anyone to read it, and it explicitly maps out the relationships between files. For example, it clearly states that DataClean.ipynb outputs FilteredEvents_1.csv, which is then presumably used by Player_Grid.ipynb.

However there are a few areas of possible improvement. The description for DataClean.ipynb mentions keeping "only the valid users" and removing data that "is not important.". Which is non-specific and can be more explicitly defined for what a valid user or important is. Otherwise a new developer has to read the code to understand the underlying business logic. Additionally, the documentation choice could've been in a README, which is the industry standard, and the documentation implies an order of operations, but explicit setup instructions could help.

Overall the documentation is easy to read and decently thorough, however there are a few things that could be addressed to improve it.
